Meeting: ICP player for different video types

Attendees: Mohammad Rashid, Harpreet Kaur, Navdeep Malhotra, Nelson Jerónimo

Objective

To review how the new ICP experience should handle different video/content types currently used in courses and identify what should be covered in Phase 1 versus what needs to be added to the backlog for later discovery.

Key Discussion Points

1. Azure Blob-hosted videos

The team confirmed that the current ICP implementation is aligned with videos hosted on Azure Blob. For this video type, the expected ICP features are working or planned clearly, including video playback, forward/backward controls, speed control, transcript support, and progress tracking.

Decision:

Phase 1 will focus only on Azure Blob-hosted videos to keep the current scope clean and achievable.

2. YouTube / external embedded videos

The team discussed that YouTube videos can be embedded and played using the YouTube player, but a custom frontend may not be able to control all player behaviors in the same way as Azure-hosted videos.

Key concerns identified:

- Completion/progress tracking may not work automatically for YouTube or other external platforms.
- Transcript behavior may differ depending on the platform.
- The transcript may need to be extracted/imported separately or handled via native YouTube transcript functionality.
- A manual **"Mark as Complete"** option may be needed for externally hosted videos.

Backlog item:

Define handling of externally hosted videos such as YouTube, Vimeo, or other third-party video platforms.

3. Mixed/combination content layout

The team identified a separate layout problem where a lesson/page may include a mix of reading content, images, HTML, graphics, embedded files, audio, and video.

This is not purely a video player problem. It is a content layout problem and needs input from the instructional design/content team.

Key open questions:

- What is this layout called internally?
- Is it a standardized content type?
- How many courses currently use this structure?
- How is completion tracked for this type of page?
- How should embedded videos inside reading/content pages behave in ICP?

Backlog item:

Discover and define the ICP behavior for mixed content/combination layouts.

4. SCORM package courses

SCORM packages were discussed as a separate structural problem. These packages behave like a complete course within a course and may come with their own navigation, player, tracking, and completion logic.

Key concerns identified:

- SCORM packages may have their own internal navigation.
- Embedding SCORM inside the ICP layout may create a confusing dual-navigation experience.
- Completion, grading, scoring, and dashboard progress may not behave the same way as native ICP content.
- SCORM packages may be created differently depending on the source/vendor.
- ICP may not be the right experience for SCORM-based courses.

Decision:

SCORM package handling will not be part of Phase 1. It needs separate discovery.

Backlog item:

Run discovery on how SCORM packages should be launched, displayed, tracked, and completed within or outside ICP.

5. Studio/content creation view

The team noted that the ICP view is currently being reviewed from the learner/frontend side, but the Studio/content creation side is still

unclear.

Key open questions:

- How do content creators currently add video assets?
- Does Studio allow Azure Blob, YouTube, Vimeo, or other links in the same field?
- How is transcript added or generated for each type?
- How does the learner-facing ICP map back to Studio configurations?

Decision:

A Studio demo is required from the content team.

Final Decisions

1. **Phase 1 scope remains focused on Azure Blob videos only.**
2. YouTube/external videos, mixed content layouts, and SCORM packages will be documented as separate backlog/discovery items.
3. A Studio walkthrough is required before finalizing future ICP behavior for non-Azure content types.
4. Sprint demos should be scheduled after every sprint to review ICP progress.

Action Items

Action Item	Owner	Notes
Add non-Phase 1 items to backlog	Rashid	These should be tracked for later discovery/implementation
Continue Phase 1 ICP work for Azure Blob videos	Product/Tech team	Current priority
Speak with Roop and organize Studio demo	Harpreet	Roop and Simran were identified as relevant contacts
Include Coursera and LinkedIn "Mark as Complete" references in mood board	Nelson	Useful for exploring completion UX
Explore possible "Mark as Complete" behavior	Nelson / Design team	Especially for external videos and long-form content
Schedule sprint demo sessions after each sprint	Rashid	Coordinate with Navdeep, QA, Nelson/design team

Phase-wise Summary

Phase 1:

Azure Blob video player, course outline, transcript.

Upcoming sprint / next phase:

Notes and downloads.

Future backlog/discovery:

YouTube/external video handling, mixed content layout, SCORM package experience, Studio-to-ICP mapping, manual completion behavior.
